

Tipp

Well-composted horse manure is an excellent, enduringly effective fertiliser for horse pastures as well as a key basis for the long-term preservation and improvement of soil fertility.

Positive characteristics of composted dung fertiliser

1. The nutrients contained in horse manure are returned to the soil and are therefore available for soil organisms and plants.
2. The horse manure serves as a source of nutrients for soil organisms, with humus formation as a long-term consequence. The humus content of the soil can only be maintained at consistent levels in the long term if organic mass is added at regular intervals.
3. The quantity and activity of soil organisms is increased through the regular addition of composted horse manure.

BioAktiv Professional Compost promotes and accelerates the rotting process. Aerobic bacteria reproduce, resulting in consistent temperatures within the compost heap. Microbes and fungi break down the seeds of undesirable weeds, pathogens and parasites. The drastic reduction in harmful gases is beneficial to both man and the environment.

Testing and analysis

Extensive testing and analysis guarantees the best possible quality standard for continuous use.

All products can be used in ecologically-managed operations.

BIOAKTIV®

Through constant contact with our customers, our sales team and our business partners ensure the regular exchange of results and scientific findings.

BioAktiv Team

This allows us to continuously adjust our BioAktiv products to various influences and conditions. Through close collaboration with development, testing and sales, we are able to develop new quality products for our customers.

Our new BioAktiv Hobby and BioAktiv Home products deliver a healthy and happy future for our consumers, animal lovers and passionate gardeners.

HORSE PASTURE

Plant strengthener

What does BioAktiv achieve?

The plant strengthener BioAktiv Hobby Horse Pasture increases aerobic bacteria and microorganisms. The formation of humus is promoted and a strong root system is developed. This enables nutrients to be absorbed by the plant more easily, thereby aiding the development of resistant and hardwearing grass cover and stable plant growth.

High-quality staple food

Improved root formation

Activation of natural soil activity

Stable plant growth

Resistant and hardwearing grass cover

Healthy soil filled with vitality is the basis for healthy growth!

Horse pastures are required to fulfil multiple requirements at the same time. On the one hand as feed staple and habitat, on the other to enable the natural desire of the horses for movement.

The level of grazing, the high bodyweight as well as trotting and galloping on the pasture mean that the soil is subjected to considerable impact, with soil compaction as the consequence.

The soil compaction means that scarcely any oxygen makes it into the soil and the number of soil organisms decreases significantly.

The absorption of nutrients and rooting activity of the plants is barely possible. Humus formation can no longer occur and soil fertility declines. The intensity of grazing by the horses means that the grass stock is unable to recover adequately and re-grow on the compacted soil.

BioAktiv Hobby Horse Pasture restores to the soil its natural regenerative energy. Aerobic bacteria and microorganisms are stimulated to multiply, enabling oxygen to re-enter the soil. This allows the soil bacteria to metabolise into humus, considerably enhancing soil fertility. As a result of this the plant stock is able to form a strong root system, thereby ensuring the nutrient supply to the plants.

Tipp

Organic fertilisation with composted horse manure through the use of BioAktiv Professional Compost. Composting is the aerobic rotting of an organic substance, i.e. decomposition through the addition of oxygen.

BioAktiv Professional Compost

The use of BioAktiv Professional Compost enables aerobic bacteria to multiply. Constant temperatures are established within the compost heap, the rotting process is accelerated.

BioAktiv Hobby Horse Pasture
1 kg / 5 kg / 25 kg

Dosage

Application is recommended **two times a year** (in April and September/October).

2 kg per ha / dissolve in **400 l** water and use this to spray the pasture

Composition

100 % Epsom salt with oxygen activation
